Sharperlight is enterprise-wide reporting and analysis at your fingertips... for all of your data sources.

Enhance your decision-making by slicing, dicing and drilling into your live data. Enable secure reporting in Excel, in the modern web browser and Power BI.

Using Sharperlight will save you time and give you unprecedented, remote access and visibility of your data, plus the ability to securely distribute reports and analysis using tools and visualizations your teams will understand.

With SAP Business One...

You will have the ability to easily consolidate data across multiple companies, simply multi select the companies that you are reporting from and build reports at the level you need for your analysis.

User Defined Fields and Tables are all automatically made available for reporting and analysis in Sharperlight's Query Builder. Visualise data as Excel® reports with our XL-Add-in or published to a web page on our web channel or on a specific user's dashboard. Reports can be securely published on an ad-hoc basis, on a range of scheduled triggers or as part of an analysis workflow.

Our SAP B1 Datamodel connects to both SQL and SAP HANA. It is bi-directional, so approved Sharperlight users can securely upload data back into the source system validated through the DI API, saving time and lengthy ETL processes, directly from Excel or a web browser.

It is this collective 'all-in-one' functionality that sets us apart as a unique toolset - **without a direct competitor in the market.**

Sharperlight has been established on the global market since 2008 and has been delivering software that is designed to empower end-users, providing the tools you need to easily create and maintain your own reporting and analysis content.

Contact us today and start your journey towards greater visibility of your data.

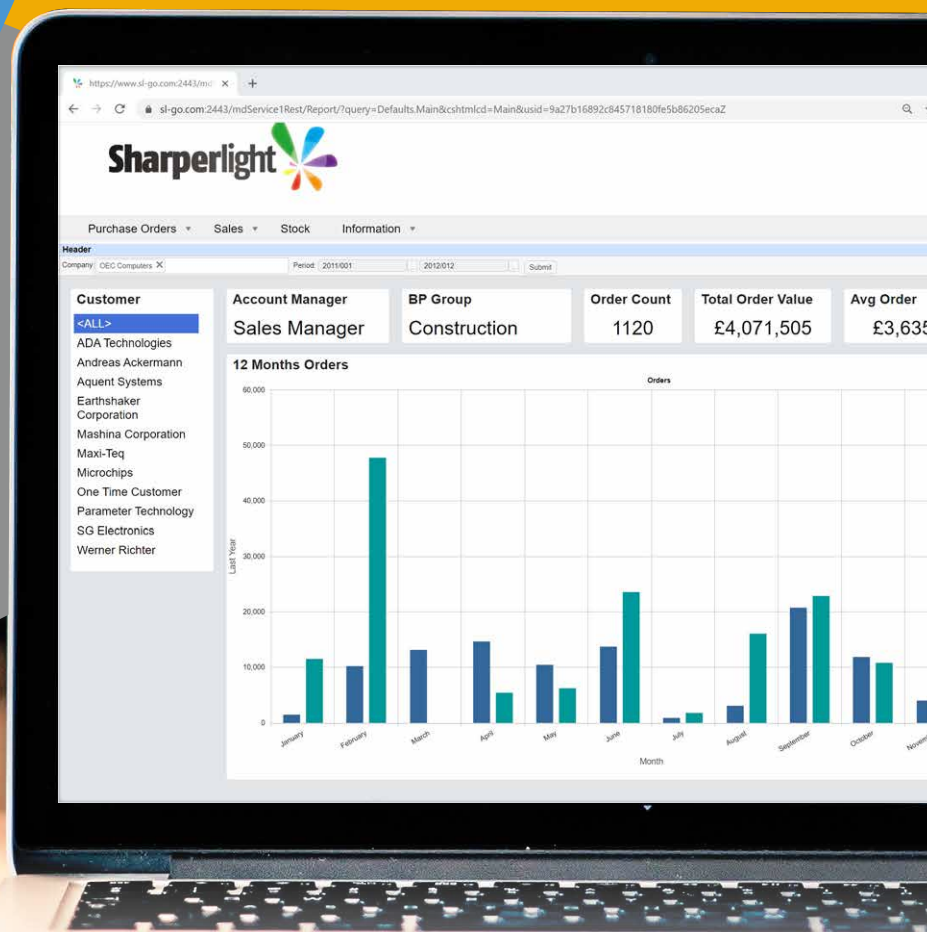

Sharperlight is a combination of tools that make it so much more than just report visualisation. Rather, it is an all-in-one solution which provides dashboards, reporting, integration of disparate data sources, automation and custom solution development that will enhance productivity in any organisation.

Our Scheduler toolset enables detailed and accurate, real-time reports, sent automatically on individually configured schedules for each stakeholder. A complete suite, with full customisation options and on-demand delivery.

Businesses also use our Materialised Queries to create agile datamarts when they need to stage large disparate sets of data from multiple sources or systems, including Legacy systems and databases or point in time reporting.

With Studio you build custom connectors to any data source including API's, Webpages and MQTT sources.

Foundry gives you the ability to easily convert your operational spreadsheets into a system with a SQL database with web entry forms and allows for reporting from within the Query builder interface.
